

# **FX** *Pocket Chronograph V2*

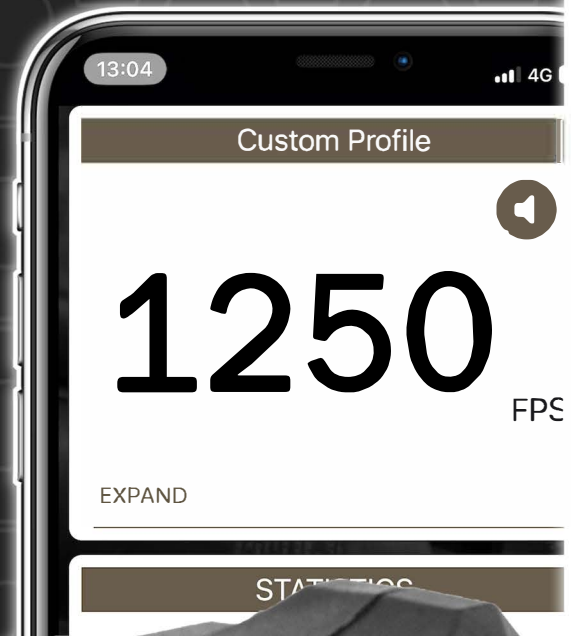

The v2 Pocket Chronograph is more pocket sized than ever at just under the size of a 2" cube. It now has an internal battery that is recharged through a USB-C cord. Multiple mounts are included that allows the shooter to attach the chronograph to their rifle in multiple ways.

The chronograph itself is a wireless radar-based chronograph. It communicates via Bluetooth to either your smart phone or the FX Chronograph Display (sold separately). The app does more than just show the feet per second of the projectile. It allows users to store multiple rifle profiles, shows shot strings, standard deviations, extreme spreads and much more.

***" UP TO 1250FPS "***

The chronograph itself can be used for more than just airguns. Any projectile traveling under 1250 FPS can be accurately measured. This includes subsonic rifles, pistols, CO2 air rifles, paintball and more.

Since the FX Pocket Chronograph v2 uses radar technology, it will work in any weather conditions, even complete darkness. Unlike other chronographs, no external light sources are needed. Simply attach the chronograph, open the FX Radar app on your phone, and start shooting!
